

Procedure for programming your BlueTooth (BT) modem

Some units are labeled EN (enable)

- 1) Connect the clip on the programmer to the KEY pin/hole on your BT modem.

- 2) Plug your BT into the connector on programmer.
- 3) Turn on the power supply the programmer is plugged into.
- 4) Set the user name and password to the desired value. Your initials are a good choice for the user name, hopefully making it unique in the class.

Quickly pressing the button moves through the different fields, while turning the knob changes the current field and finally pressing the button for two seconds and then releasing starts the programming of the BlueTooth modem.

- 5) Wait for the programming process to complete, then turn off the programmer and remove your modem.
